

FRIDAY JUNE 24, 2011

It's been months since you've been using an age-defying cream. Yet those unwanted fine lines and deep wrinkles are still there. You can feel them. What's worse is you can still see them. Now it is totally understandable if your patience is wearing thin. Don't you just wish there's an age-defying product that can absorb deep into your skin and plump up all those annoying wrinkles in just 4 weeks of usage?

## Improved Hyaluronic Acid formula - 50X smaller molecule and 5X more concentrated

Eucerin, the specialist skincare expert, is proud to present the new Eucerin Hyaluron-Filler Day with 5X more concentration of high and low molecular Hyaluronic Acid to diminish the appearance of even the deepest wrinkles on your skin. While the high molecular Hyaluronic Acid works to smooth fine wrinkles at the skin's surface, the newly added low molecular Hyaluronic Acid with 50X smaller molecules, penetrate deeper into the skin and intensifies the plumping effect on your skin.

\*Compared to former Eucerin Hyaluron Filler Day Cream

A dermatologist speaks

“Hyaluronic Acid avidly binds water, effectively moisturises and ‘plumps up’ the skin.”

Dr. Wong Su Ni, Vice President of the Dermatological Society of Singapore

## Reduce 20% of wrinkle depth in 4 weeks!

As skin's own 'fillers', Hyaluronic Acid molecules are found in the connective tissue matrix of human skin, which plays an essential role in maintaining the volume beneath the skin. These molecules possess an amazing capability to bind moisture up to 1000X its own weight, thus effectively plumping up the skin from the inside, giving it a smooth and supple appearance. Clinical results have shown that wrinkle depths are reduced by an average of 20% in just 4 weeks of using the Hyaluron-Filler Day Cream, which is the **equivalence of 3 years in biological aging.**

## Dermatologist recommended with no side effects

Hyaluronic Acid is naturally present in our bodies, so its introduction is well tolerated and poses no risks, unlike injections or other painful invasive procedures that may have potential risks and downtime. Hyaluronic Acid is also recommended by dermatologists internationally and it is well tolerated with no known side effects.
